// FINANCE & HEALTH HUD

MRLN

THE COMPLETE GUIDE

Free · **Offline** · **Private** · one self-contained file

https://sagemrln.github.io/my-first-repo/

1. What MRLN is (and why it exists)

MRLN is a personal **command center for your money and your body** — one cyberpunk dashboard that turns your real numbers into a plan you can actually follow.

It was built around four hard rules:

PRINCIPLE	WHAT IT MEANS FOR YOU
Free	No subscriptions, no paid APIs, no accounts. Ever.
Offline	Everything runs in your browser. Once loaded it works with the plane on airplane mode.
Private	Your data **never leaves your device**. Nothing is uploaded, tracked, or sold.
Single file	The whole app is one self-contained HTML file — nothing to install, easy to back up.

The purpose: most finance/fitness apps want your data and your money. MRLN wants neither. It gives you the math, the projections, and the honest verdicts — and keeps all of it on your phone.

2. Getting in — the access key

MRLN opens **locked**. You unlock it once with an **access key** (a code that looks like `MRLN-…`).

- The key is **cryptographically signed** — it can't be faked or guessed.
- It's **time-limited** (a tester key might last a week; a personal key, years). When it expires, the app re-locks — even mid-session — and asks for a new one.
- Once entered, it's **remembered on that device**, so you don't retype it every time.
- Keys are tied to access, **not** to your data. Renewing a key never touches your numbers.

Three ways a key can be scoped:

- **File-bound** — works only on one specific file/link (its "File ID", e.g. `#F-AB12CD`).
- **Universal** — works on any link or installed copy (used for testers and the owner).

3. Languages & currencies

Top of the screen is the **locale bar**: 🌐 Language · Currency · Country.

Languages (7): English, Español, Dansk, Deutsch, Svenska, Norsk, **Magyar**.
Switching translates **the entire interface** instantly — tabs, headings, buttons, help text, the setup wizard, everything. A built-in **language watchdog** runs constantly: it re-checks every screen — including text that only appears in certain situations (your plan, tax breakdown, calendar, logs) — and keeps it all in your chosen language, with nothing left in English.

Currencies (11): USD, EUR, GBP, DKK, SEK, NOK, CHF, CAD, AUD, JPY, **HUF**.
Currency is a **real conversion**, not just a relabel. Switch from kr to € and `8,000 kr` becomes `~1,070 €` at the bundled offline exchange rate. Every stored figure — income, expenses, loan, savings — converts together, and switching back returns the original amount. (Rates are an offline snapshot; no server needed.)

🔷 4. First-time setup (the wizard)

On first unlock, a short wizard sets you up in under a minute:

1. **Welcome** — language, currency, country (or tap *"show me a filled example"*).
2. **About you** — name (optional age/work/birthday/ethnicity*, phone & main device).
3. **Your income** — typical monthly take-home, plus optional slow/good months, debt payment, savings target.
4. **Your expenses** — quick-add chips or type your own.
5. **Sports & hobbies** — added to your calendar as weekly repeats.
6. **Getting around** — transport costs; mark anything *financed* and it drops off your budget automatically once it's paid off.
7. **Install** — tailored guide to add MRLN to your home screen (iPhone / Android / PC).
8. **Review** — your starting picture.

* Ethnicity is used **only** to set accurate WHO health thresholds (BMI/body-fat). It never changes calorie targets.

You can re-run setup anytime with ⚙ **Setup**, or skip it and fill things in yourself.

🔷 5. The Money side

Overview — *Mission Briefing*

Your headline: left-over money in a typical month, comfort margin, and worst-case month. The single glance that tells you if the plan holds.

Income

Your monthly take-home across **slow / typical / good** months. The **typical** month is the baseline every simulator uses.
→ To change income, use 💬 **Quick Update** (e.g. *"I earn 18000 a month"*).

🧾 Tax Helper (inside Income)

An offline **estimate** of your income tax, adapting to your country/region:

- What you'll pay, what to expect back.

- **Denmark:** full model — AM-bidrag, personfradrag, beskæftigelsesfradrag, bund/kommune/kirke/topskat — plus **forskudsopgørelse** suggestions (trækprocent + monthly fradrag) and an **over/under-estimate simulator** (set your expected annual vs. actual → refund or owe).
- Models for every country whose language we support (DK/US/GB/DE/ES/SE/NO) + a generic fallback.
- Always unofficial — verify with your tax authority. Numbers stay on your device.

Expenses — *Expense Breakdown*

A read-only, grouped view of every recurring cost (with monthly/yearly totals). "Varies" items are left out of the total.
→ The **"Edit items →"** button jumps you to **Subscriptions**, where editing lives.

Subscriptions — *where you edit everything*

- **Add a Subscription / Recurring Cost** — add any cost to any category.
- **Manage Items & Categories** — edit a price, change billing frequency, or delete **any** item (base or added), and add/remove whole categories. Live numbers recompute instantly.
- **Subscription Ledger** — every recurring cost with what it is and why you keep it.

Loan & Debt

Track a loan payment, amount, and (optional) interest rate; toggle whether it counts in your monthly math.

Cash Flow — *Cash-Flow Simulator*

Drag the income slider to see any month play out: income − costs − loan − savings = what's left. The range auto-fits your real income. Below it, an **8-year savings-growth projection** charts your pooled savings across low/typical/good scenarios with 1/3/8-year milestones.

Savings — *rules + boxes*

The "**Savings**" tab opens with the short list of **wealth-building rules** (pay yourself first, build a buffer, make it earn, clear pricey debt first, bank your good months) — the habits that do almost all the work.

Below the rules are your **Savings Boxes** — Lunar-style pots. Make a box for each thing you're saving for (a holiday, a new phone, an emergency cushion). Tell it what it **holds now**, what you **add** (monthly / quarterly / yearly, or top up by hand any time), and an optional **interest rate** and **target**. A slider projects every box **X years ahead** — what it becomes, what you put in, and exactly **how much the interest earns you** — with a progress bar and an honest "reach it in ~N years." All boxes total up, and every figure converts with your currency.

Your Life Tier + Your Personalized Plan (Checklist)

An honest, S→F **tier rating of your money life**, built **only from your own numbers**, with a ranked, realistic action plan that updates as your numbers change.

Checklist — *Action Checklist*

Concrete next actions (build a cushion, automate savings, etc.).

Klarna Float *(master-only tab)*

A clear, honest breakdown of interest-free pay-in-2 as a **zero-cost liquidity bridge** — with a safe-size rule, a cash-flow simulator sized to your surplus, and an honest verdict (GOOD / OK / TIGHT / BAD). Shown only on the owner's master (or after importing it).

---

6. The Health side

Gym Plan

- **Body Stats** — sex, age, height, weight, activity, body-fat. Feeds everything below.
- **Body Grade & Shape** — an S→F physique grade, body-fat/muscle read, and a visual silhouette.
- **Body Measurements** — track measurements over time.
- **Calorie Simulator** — your BMR/TDEE and a slider for cut / maintain / bulk, with honest verdicts ("aggressive deficit", "lean surplus", etc.).
- **Meal Ideas** — suggests the **healthiest tasty meals for your goal**, respects likes/dislikes (typo-tolerant — "avoid chesse" still works), pins favourites, rotates fresh ideas, and surfaces the healthiest pick.
- **Personal Records (PRs)** and **Workouts / Training Split** — log lifts and your weekly plan.

Food Log

- **Log a meal** by **typing** ("2 eggs and rice") — an offline estimator reads quantities/units and returns calories + macros — and/or attach a **photo**.
- **Today** total, **History**, delete — your daily food diary, fully offline.

---

7. Organize & track

Calendar

Add dated events and notes; one-off, weekly, monthly, or yearly repeats (birthdays 🎂 included). Hobbies and transport from setup land here automatically. **Reminders** 🔔 included.

Stats & Grades

A roll-up of your grades and key stats across money and body.

Notebook

A built-in notes app (like iPhone Notes) — title + body, autosaved, private.

8. Installing the app

Installing is **front and centre**, not buried in a menu:

- **Lock screen** — before you even sign in, short **"Add to Home Screen"** guides for iPhone and Android sit beside the unlock card.
- **"Get the app" banner** — a bright banner across the top of the dashboard. Tap **Install** and it either installs in **one tap** (Android / Chrome / Edge) or opens a **step-by-step** card for your exact device (iPhone Safari, Android, or desktop).
- It **removes itself automatically** the moment the app is installed — no clutter once you're set up.

9. Connect — move data between devices

The hub for everything that crosses devices (all **on-device**, nothing uploaded):

- 🔒 **Backup & restore** — make a private **data code** of everything and paste it onto another device; or 📦 **Import my master file (.html)** to load an entire saved file in one tap (data + Klarna tab; never the owner key).
- 📥 **Import from another app** — bank/card **CSV** → income & expenses; **.ics** → calendar; Apple Health/CSV → weight; MyFitnessPal CSV → food log.
- 📤 **Export to other apps** — your calendar as **.ics**, expenses/food as **CSV**, or the native **Share** sheet.
- 📱 **QR transfer** — move your link/data by scanning a QR code (generated fully offline).
- ⚖️ **Bluetooth scale** (in Gym) — read your weight straight from a compatible scale.

10. 💬 Quick Update — the plain-English updater

The fastest way to change things: tap 💬 **Quick Update** and type changes in plain language, one per line. It's interpreted **free, offline, in your browser**, and **nothing changes until you confirm**. It understands:

- Income — *"income is now 2600"*, *"good month income is 22000"*
- Costs — *"add Gym 29/mo to Other"*, *"rent is now 1200"*, *"cancel Netflix"*
- Loan / savings — *"loan payment is 1500"*, *"save 400 per month"*
- Categories — *"add category Pets 🐾"*
- Profile — *"name is Alex"*, *"work is now Acme Ltd"*, *"I'm 24"*
- Body — *"I weigh 82kg"*, *"height is 180"*
- Calendar — *"note 2026-07-15 Mum's birthday"*
- Workouts — *"workout Monday: push day"*

11. Updates — how new features reach you

- **On the hosted link / installed app:** updates are **automatic**. Open it online and the newest version loads itself (network-first service worker); offline still works from cache. Your data is preserved across every update — no migration, no re-login.
- **On a downloaded file:** that file is frozen. To get new features, open the hosted app (or a newer file) and **import your data** across.

Tip: running your master *on the installed app* gives you the best of both — your data + auto-updates.

12. Privacy & anti-tamper (the security model)

- **Your data is yours.** It lives in your browser's local storage (and embedded in your saved file). It is never uploaded — there's no server to upload to.
- **Unforgeable access.** Keys are signed with a private key that exists **only** in the owner's master file. The public app holds just the public half — enough to verify keys, never to make them.
- **Tamper = poison.** Three independent watchdogs detect a bypassed lock (overlay removed, public key swapped, verifier neutered). If anyone defeats the lock, an integrity token flips and **poisons every number** — finance, body/calories, tax, and food all become `NaN` — and a full-screen warning appears. A broken app is worthless to a thief.
- **Clean shares.** Any blank/customer copy is **hard-stripped** of all personal data and of the owner key, so nothing private can leak into a file you hand out.

13. For the owner — running the show

These tools appear only on **your master file** (where the private key lives):

- 🔑 **New / renew key** — mint a key for anyone: pick a name and duration (minutes → years). Optionally bind it to a specific File ID, or leave it universal.
- 📤 **New file + key** — birth a fresh, blank customer file **and** the single key that unlocks it, together. (Never share your master — only the file+key it creates.)
- **Klarna Float** tab is visible here (and on any copy that imported your master).

Releasing updates: edit `index.html`, push to `gh-pages`. Everyone on the hosted link/app gets it on next online open. Only bump the service-worker version when you add/rename a static asset (icons, etc.).

Your master file auto-unlocks on your devices, holds your real data, and can mint keys. Keep it private; back it up; never hand it out.

14. Quick troubleshooting

SYMPTOM	FIX
"This key expired"	Get/mint a new key. Keys are time-based by design.
"This key belongs to a different file"	You're using a file-bound key on the wrong file. Use the key that came with **this** file, or a universal key.
Installed app asks for a key again	Installed apps have separate storage from the browser tab. Enter your key once in the installed app; a universal key avoids file-ID mismatches.
Opened the link and it's blank with no key prompt	A bare link (no `#F-…`) opens a fresh empty app, and/or your browser already had a saved key. Your data lives in your file — import it from Connect.
Can't find where to edit expenses	Expenses is read-only; edit in the **Subscriptions** tab (use the "Edit items →" button).
Numbers show as NaN + a red warning	The tamper guard tripped. Use the original, unmodified app with a valid key.

MRLN — your money and your body, on your terms, on your device.
